JOB DESCRIPTION

RADIX WORKFLOW TEST · DOCUMENT ID: TEST-JD-001

Role	Junior Python Backend Engineer	**Level**	Entry-level / 0–2 years
Team	Platform Engineering	**Work mode**	Hybrid · Noida, India
Employment	Full-time	**Test benchmark**	Synthetic; not a real vacancy

Role summary

We are testing a fictional backend engineering role for a candidate-assessment workflow. The engineer will build and maintain Python APIs, work with relational data, write automated tests, and collaborate with frontend developers. This document intentionally uses explicit skill labels so extraction and matching can be checked consistently.

Required skills

- Python programming
- FastAPI or REST API development
- SQL and relational databases
- Git version control
- Automated testing with pytest
- Problem solving and data structures

Preferred skills

- PostgreSQL
- Docker and containerisation
- Redis caching
- CI/CD pipelines
- TypeScript or React fundamentals

Responsibilities

- Implement and document REST endpoints using Python and FastAPI.
- Write SQL queries and work with PostgreSQL tables and indexes.
- Create unit and integration tests using pytest.
- Use Git branches and pull requests for collaborative development.
- Package local services with Docker and investigate Redis caching where appropriate.
- Collaborate with frontend engineers using clear API contracts.

Minimum qualification

Bachelor's degree in Computer Science, Information Technology, or a related field; final-year students and recent graduates may apply. A project portfolio is accepted in place of full-time experience.

Screening note

This is synthetic test content created only to validate document upload, skill extraction, workflow sequencing, and candidate-to-JD matching. Do not treat it as a live job advertisement.

EXPECTED EXTRACTION CHECK

Required list contains 6 skills; preferred list contains 5 skills. Exact phrasing may be normalised by the parser, but the two groups should remain distinguishable.
